Using feed intake behavior and feed bunk attendance to detect dairy cow health issue at an early stage

Paolo Berzaghi, Giulio Cozzi, Flaviana Gottardo, Marta Brscic

Department of Animal Medicine, Production and Health
University of Padova, Italy

Individual feed intake measurements

- It is labor intensive
- In free stalls animal it is necessary to use special devices (e.g. calan gates).

Our demand was for a system

- To be used in free stalls with access to the entire feeding bunker
- Able to record feed intake, bunker attendance, time of visits
- easy to use

Automatic feeding recorder

- 14 feeding gates divided into 2 pens
- Each feeding gate:
 - Antenna to identify cow access (De-Laval transponder)
 - Manger with a volume of about 1 cubic meter holding about 80 kg of TMR
 - Mangers are placed on loading cells
- When cow enter a gate:
 - Antenna identify cow ID
 - System records starting time and starting feed weight
- When cow leave the gate
 - System records ending time and ending feed weight

14 feeding gates divided into 2 pens

Biocontrol A/s, Norway

Biocontrol A/s, Norway

Automatic feeding recorder

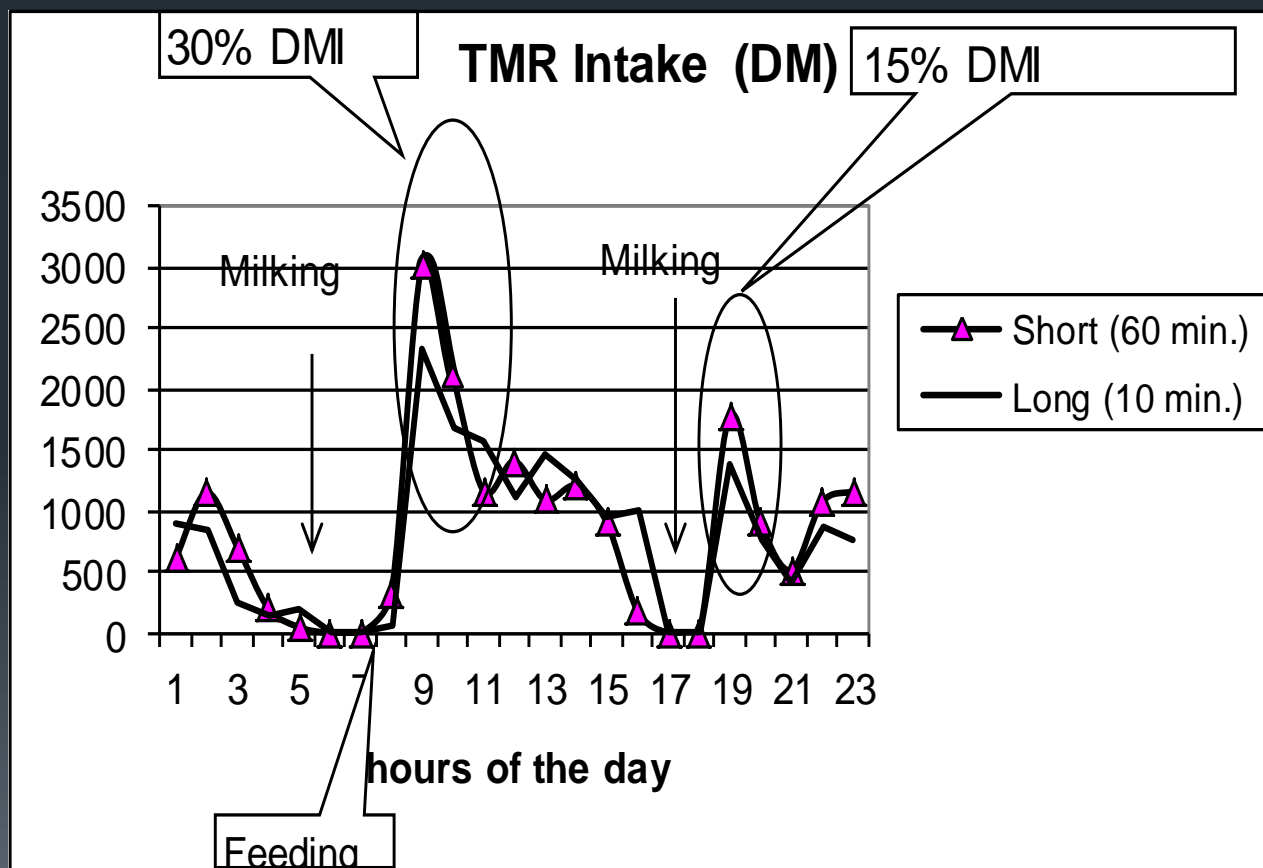

- One controller box every two mangers
 - Tare of loading cells
 - Cleaning and loading mangers
 - Collecting single logs
- One central PC
 - Collects logs every 5 minutes from all of the controller boxes
 - Calculate individual intake feeding data (amount, time, rate)

Biocontrol A/s, Norway

Measuring individual intake

- It is definitely necessary in any feeding trials

(Trial: mixing time)

Measuring individual intake

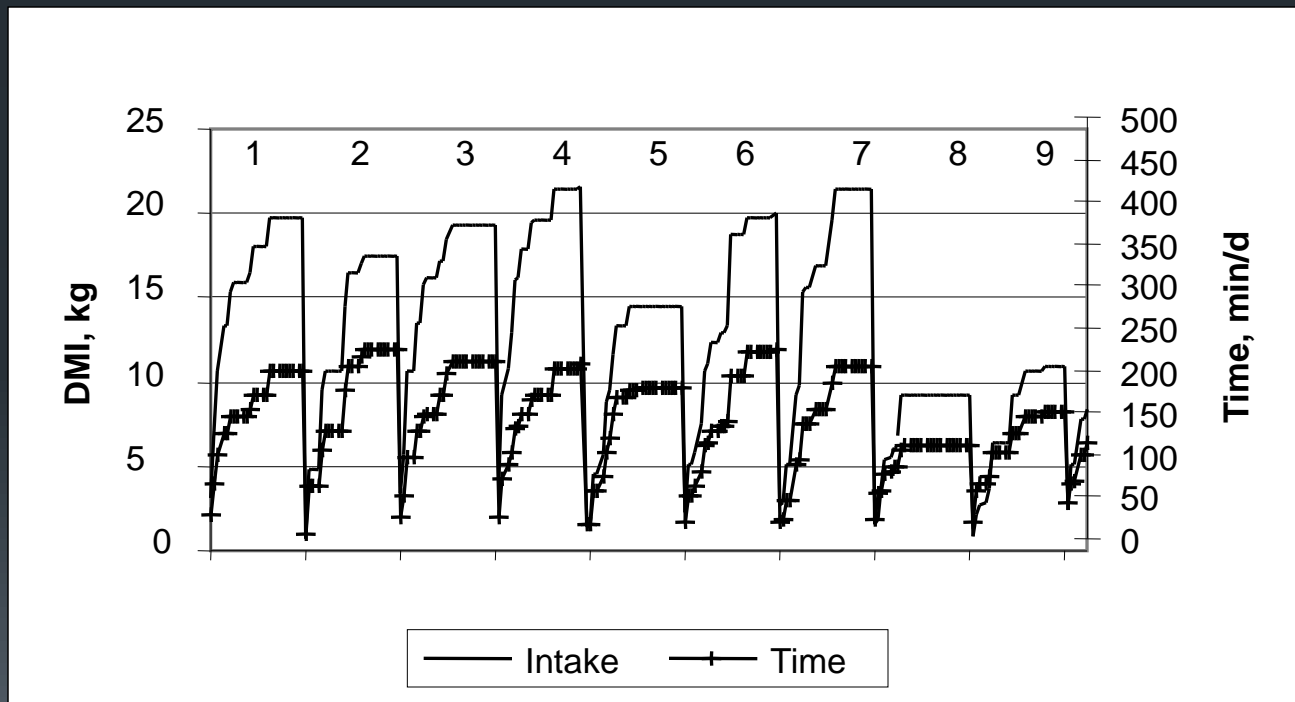

- Beside Research is there any economical value of measuring individual intake under *ad-libitum* TMR feeding systems??

Individual actions

- Individual intake data could be very useful when individual feeding action can be implemented:
 - Robot milking with concentrates supplementation during milking
 - Partial TMR = TMR + autofeeders (nice, but very expensive)
 - Liquid feed in the water (Energy drinks!!!) with limited access

Feeding TMR to milking cows

- When feeding by group(s), there is a little value from individual intake data, but may be, it can be used to early detect problems COWS

Identify sick cows at an early stage

- Define normal cow feeding behaviour for
 - Feed intake (kg as fed)
 - Feed bunk attendance (min)
- Based on cumulative data, starting at feeding time
 - Cumulative hourly feed intake and feed bunk attendance

Identification of abnormal feeding behaviour

Cumulative feed intake and feed bunk attendance

- Simple model
 - Average and SD across 6 normal days
 - 95% confidential limits

Identification of abnormal feeding behaviour

Cumulative feed intake and feed bunk attendance

■ Exponential model

- Cumulative data of 6 days fitted with an exponential asymptotic function
- $Y = b \cdot (1 - e^{-k \cdot t})$
- 95% confidential limits
- Model RSQ=0.86

Pattern of TMR Intake, kg as fed: simple hourly mean \pm SD over 6d

Pattern of TMR Intake, kg as fed:

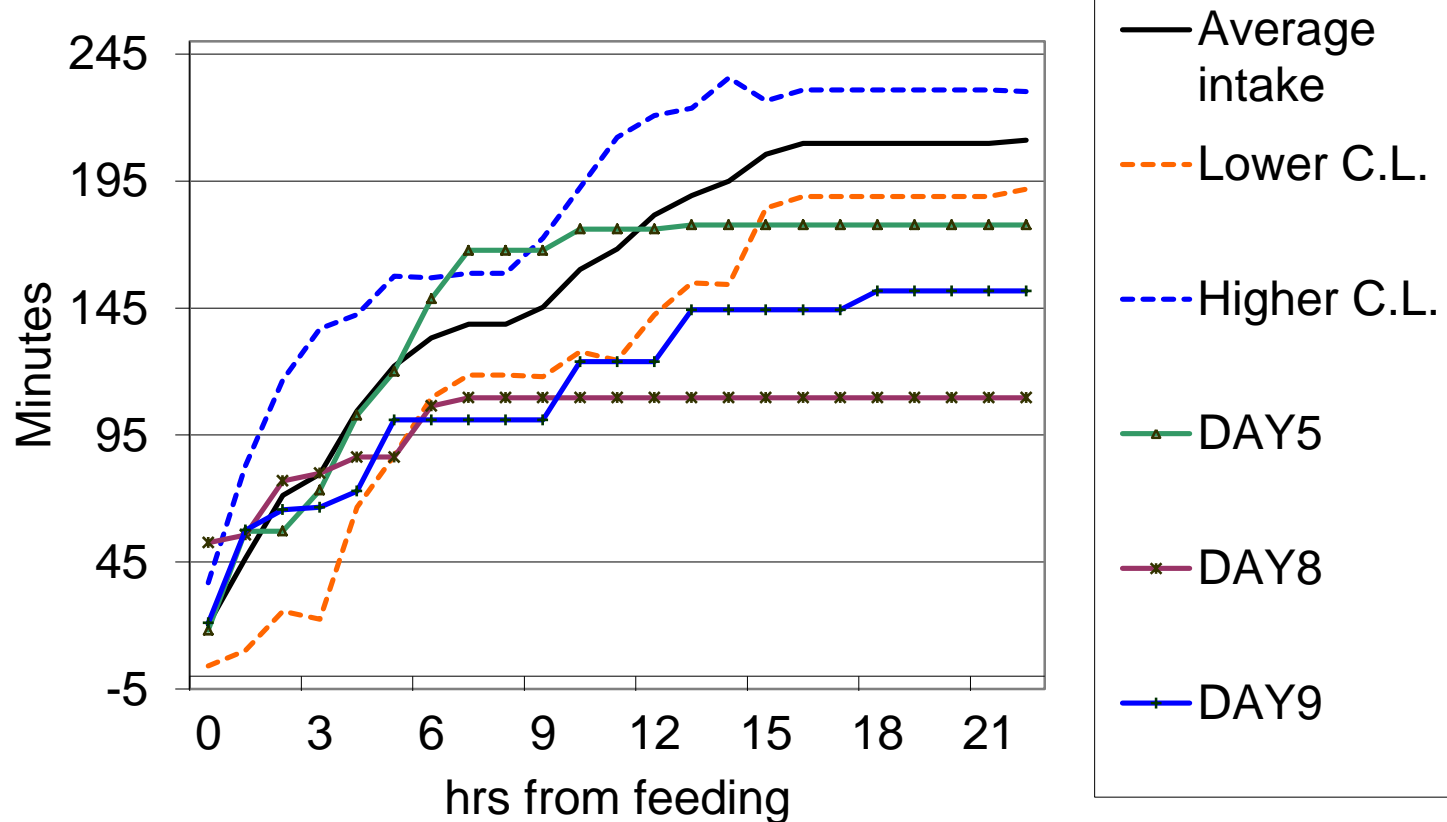

Exp Model $Y=b*(1-e^{-k*t})$

Pattern of TMR Intake, kg as fed: alarms after feeding, hours

	Models	
Day	mean±SD	$Y=b*(1-e^{-k*t})$
5	12	21
8	5	8
9	4	3

Pattern of Bunker attendance, min: simple hourly mean \pm SD over 6d

Pattern of Bunker attendance, min:

Exp Model $Y=b*(1-e^{-k*t})$

Alarms after feeding, hours

	mean±SD		$Y=b*(1-e^{-k*t})$	
	Intake	Time	Intake	Time
5	12	15	21	21
8	5	6	8	8
9	4	6	3	7

K.I.S.S. principle?

- Simple model based on Mean and SD works!!!!
- Modelling works too and more sophisticated behavioral model may work even better
- In a farm environment, recording bunker attendance would be cheaper to implement and easier to run than intake measurements

Paolo's fantasy farm (milk price >0.4€/l)

- Transition cows:
 - DMI measuring system;
 - PMR with daily correction of concentrate allowance using autofeeders to maintain energy balance
- Fresh (0-45 DIM):
 - DMI measuring system;
 - TMR (PMR?)
- Rest of lactating cows:
 - TMR
 - Bunker attendance measurements used to estimate DMI
 - Rate of intake is fairly constant in each cows (CV=4.8%)

Hvala
